

6G Concept Optical Module

Overview

This module explores Optical Wireless Communications (OWC) as a key enabling technology for 6G networks. Students examine fundamental principles, emerging technologies including LiFi and VLC, and design considerations such as channel modeling and interference management. The anticipated launch of the Sixth Generation (6G) of mobile technology by 2030 will mark a significant milestone in the evolution of wireless communication, ushering in a new era with advancements in technology and applications. 5G, AI and IoT familiarity helpful but not required. While valuable lessons have been learned from the design, deployment, and operation of 5G and Beyond in Europe, new requirements, emerging technologies, and evolving business models explored by the Smart Networks. 6G networks are expected to deliver data rates up to 1 Tbps with sub-millisecond latency, driving unprecedented demands on optical communication infrastructure. Creating a version of the technology that is suitable for radio applications will, however, require some dedicated.
