

Applications of circular beam splitters

Overview

The beam splitter transmits one linear polarization of light and reflects the orthogonal component to the side. They play a critical role in many fields, including scientific research, medical imaging, entertainment, and, for many innovative optical applications. The Moxtek RCPBS family of products can be used to increase optical path length without increasing physical length, isolate or sample back r t-handed • Increase optical pat and performanc Wide angle o proven wire-grid beamsplitting technology. Fabricated from high-quality N-BK7 glass, it features a second-surface broadband AR coating (ARB2 NIR) to minimize. A beam splitter, essentially, is a device capable of directing light into two distinct paths. When a light beam encounters these cubes, half of it penetrates the glass, while the other half gets reflected. Depending on the application, they can also combine two beams into a single beam.
