

Botswana Long-Distance Optical Cable OM5

Overview

OM5 is the sole fiber with SWDM (Short Wavelength Division Multiplexing) capability. It operates across four wavelengths from 850 nm to 953 nm. You don't need extra fiber cables. OM5 fiber, also called Wide Band Multimode Fibre (WB-MMF), is the newest type of multimode fiber cable standard. Compared to OM4, the OM5 standard calls for a modal bandwidth of both 4700. The topic of this article, OM5 fiber, is a multimode fiber cable designed for high-bandwidth, short- to medium-range applications. It's the first approved wideband multimode fiber (WBMMF) for applications that use two fibers to transmit at 40-100 Gbps using shortwave wavelength-division. Constructed with a robust armored layer, this fiber patch cable offers superior protection against physical damage, making it suitable for outdoor and industrial environments. Each one is built for specific bandwidth and distance needs. They differ in core size, light source types, and what they can transmit. O-D standards released in 2017.
