

Electrical distribution box installed in the refuge room

Overview

In the refuge, ADB2 recommends that the EVC system consists of Type B outstations communicating with a master station in the building control room (should one exist) or next to the fire detection and alarm panel. It is permitted for the EVC system to be wireless. BS 9999 Matt Tighe, Technical Service Manager at ESP, looks at the specific recommendation for refuge areas to be provided with an emergency voice communication (EVC) system conforming to BS 5839-9 and the provision of such an EVC system. Covers wiring, placement, standards, and expert tips for a compliant setup. Disabled Refuge Systems (also known as Emergency Voice Communication Systems or EVCs) offer an uncomplicated and efficient two-way communication system for these areas, which can aid rescue teams in identifying where aid is necessary and reassuring individuals that assistance is imminent. To address this there is a final exit. Thus constituting a temporary safe space for disabled.
