

Grounding copper busbar of relay protection panel

Overview

A copper grounding busbar with a cross-sectional area of not less than 100 mm² shall be installed at the bottom of each relay protection and control panel. Simply put, it establishes an equipotential bonding network, which is then connected to the. Common methods of protecting busbars include overcurrent-based interlocking schemes, overcurrent-based differential protection, high-impedance differential protection, and percentage differential protection. Interlocking and overcurrent differential protection can be implemented with any suitable. A busbar is a strip or bar of copper, brass or aluminum that conducts electricity within a switchboard, a substation or a battery bank. Its purpose is to conduct a substantial current of electricity. ABB's busbar protection is designed for phase-segregated short-circuit protection, control, and. Busbar protection (BBP): Protection intended to detect and operate to clear faults on a busbar. These grounding bus bars are highly customizable, featuring a variety of hole and slot patterns to meet specific project requirements.
