

How far can a router's optical module transmit data

Overview

Under 1550nm wavelength, 100Mbps and 1Gbps optical transceiver modules can transmit up to 160km, and 10Gbps optical transceiver modules can transmit up to 80km. Optical modules are crucial for today's communication systems as they convert electrical signals into light signals for rapid data transfer. Understanding their key parameters isn't just technical jargon – it's critical for ensuring compatibility, performance, and reliability in your data center. Fiber-optic communication is a form of optical communication for transmitting information from one place to another by sending pulses of infrared or visible light through an optical fiber. The light is a form of carrier wave that is modulated to carry information. Long Reach Multimode (LRM). Fiber optic transmission distance varies based on fiber type, environmental conditions, and equipment selection. Key. First is the attenuation of the optical fiber.
