

# Is the network port panel for connecting a network cable or a fiber optic cable

## Overview

Think of a patch panel as the backbone of your wired network. It's a flat, rack-mounted hardware unit that houses multiple cable connections in one central place. These connections can be for Ethernet cables, fiber optic cables, or even audio-visual wiring. Patch panels are one of the best ways to manage an expansive local area network (LAN) by providing quick and easy access to the ports and connections that connect them altogether. They come in a range of sizes, and are typically mountable, whether that's on a wall, or on a rack to make for easier. A fiber patch panel is a mounted enclosure—either rack-mounted or wall-mounted—used to terminate, manage, and interconnect multiple fiber optic cables. It acts as a central point for neatly labeling and laying out all network cables, preventing tangled knots of CAT5 cables in a Local Area Network. A patch panel is a simple, passive device that serves as a physical interface for cable management.
