

Palau Meter Light Source Power Meter

Overview

A typical optical power meter consists of a calibrated sensor, a measuring amplifier and a display. The sensor primarily consists of a photodiode selected for the appropriate ranges of wavelengths and power levels. On the display unit, the measured optical power and set wavelength is displayed. Overview An optical power meter (OPM) is a device used to measure the power in an signal. The term usually refers to a device for testing average power in systems. Other general purpose light power measuring. The major types are (Si), (Ge) and (InGaAs). Additionally, these may be used with attenuating elements for high optical power testing, or wavelength. A typical OPM is linear from about 0 dBm (1 milli Watt) to about -50 dBm (10 nano Watt), although the display range may be larger. Above 0 dBm is considered "high power", and specially adapted units may measure u.
