

Principles of Optical Cable Line Maintenance

Overview

Monthly Maintenance: Randomly inspect fiber optic cable connections, test backbone fiber optic link attenuation, and clean connector end faces. 25 deals with general features in relation to the maintenance and operation of optical fibre cable networks. This article will explore the three core stages: fiber optic cable selection and installation, usage and maintenance, and aging assessment and replacement. Small oil micro-deposits and dust particles on fiber optic cable optical surfaces may cause a loss of light or degraded signal power which may ultimately cause intermittent problems in the optical connection. Some people have suggested that fiber optic networks need periodic maintenance, including microscopic inspection of connectors and mating adapters and even insertion loss testing or taking OTDR traces. It could hurt an installer or get them sued by an irate network owner. Keeping your fiber network performing at its best isn't just about how you build it, it's how you maintain it. Follow these seven practical steps to reduce signal issues, extend equipment life, and avoid unnecessary downtime. **CLEAN BEFORE YOU CONNECT** Always clean connector end-faces before.
