

# Remote-controlled distribution network automation terminal

## Overview

Remote Terminal Units (RTUs) are field-deployed, microprocessor-based devices designed to interface between field equipment and supervisory control systems. They collect measurement data, execute control logic, and transmit real-time status, alarms, and events to SCADA or DCS. The Netcon 200 is a smart RTU (remote terminal unit) for monitoring medium-voltage feeders along with the remote control of the associated circuit breakers and switches. Standard protocols and interfaces make the connection to other systems straightforward. An RTU operates as a distant control system by extracting information from multiple field devices including sensors and actuators and. This enables a secure and economical remote access to plants in the process industry, in automated manufacturing, or in public infrastructures – regardless of their scale. While the data. Automated power restoration with feeder automation devices including fault passage indicators (FPI), remote terminal units (RTU) and SCADA monitoring software. A Remote Terminal Unit (RTU) is an industrial data collection and communication device used in SCADA systems to monitor and control remote field equipment.
