

Single-strand distribution box cross-door grounding

Overview

Attach a ground wire from one of the threaded studs (A) at the bottom of the housing, to the mounting plate (B). Next, we describe directional elements suitable to provide ground fault protection in solidly- and low-impedance grounded distribution systems. We then analyze the behavior of ungrounded systems under ground fault. If you've ever found yourself scratching your head over whether that metal door on your distribution cabinet really needs a grounding wire, you're not alone. Each DISTRIBUTION BOX and controller must be grounded. 26 mm² (10 AWG) ground wire must be used, and in all other markets a 6 mm² must be used. Knowledge of the various types of system grounding and performance characteristics is critical when designing or operating an electrical system. During fault conditions, low impedance results in high fault current flow, causing overcurrent protective. The concept of "screens cross-bonding" is well-known to those power engineers who use single-core cables with cross-linked polyethylene insulation (XLPE).
