

## UK Low Voltage Switchgear

### Overview

LV stands for Low Voltage Switchgear. It is a 3-phase power distribution product, which is designed to efficiently, safely and reliably supply electricity around a building or structure in a controlled and safe manner. LV switchgear is usually rated at 400VAC three-phase and can supply loads of up to 6300 amps. An LV switchboard is supplied by either a main LV switchboard or a substation. An LV switch room is a controlled area where the main LV distribution is situated. The LV switch room is a central space which can contain the main LV switchboards, package substations and other critical LV distribution. The main function of LV switchgear is to distribute power around a building or structure in a safe and controlled manner.
