

What are the standards for optical cable bending resistance testing

Overview

IEC 60794-301:2023 describes test procedures to be used in establishing uniform requirements of optical fibre cable elements for the mechanical property – bending. Measuring and validating bending stiffness is essential for designing cables that can withstand physical manipulation without degrading performance or risking. There are several methods of fiber optic cable testing, each serving a specific purpose in assessing the cable's performance and reliability: Optical Loss Test Sets (OLTS): This method measures the total light loss in a fiber optic link, simulating the network conditions. This testing is defined by IEC 61300-2-44. Digital downloads are PDF versions of the Standard that you can instantly download from a link sent to you after purchase is confirmed. Some Standards also include XML versions, which allow you to view your Standard online at any time.
