

What are the types of hybrid optical cables

Overview

A hybrid cable combines two transmission media: Optical fibers for data, typically single-mode or multimode. Copper power conductors, usually low-voltage DC to supply the kind of device used in remote radios or IP cameras. Combining them in this manner makes installation easier, reduces cabling density, and provides a more stable. Hybrid cable is a combination of different types of cables bundled together into a single sheath. Typically, these cables combine. In telecommunications, fiber optic cables, twisted pair cables, and coaxial cables are commonly known to people for their wide usage. On campus networks, hybrid cables are typically used to connect access switches and WLAN APs, so that the access switches can supply PoE power to the APs. Recommendation ITU-T L. Technical requirements may differ according to the installation environment.
