

What coding scheme does the beam splitter belong to

Overview

Based on generalized Snell's law, we designed the beam splitters using a coding strategy by phase gradient metasurfaces, which can divide vertically incident light into two-dimensional space. It is a crucial part of many optical experimental and measurement systems, such as interferometers, also finding widespread application in fibre optic telecommunications. Beamsplitters are often classified according to their construction: cube or plate. When integrated into specialised lenses, the beam splitter divides the incoming light into two paths: one beam illuminates the object, while the other is used for image capture. Don't forget to zoom the tilt of the splitting surface Email tech support. Do you need to model interference?

Or just split the beam?
