

What is FDX for optical modules

Overview

Full Duplex DOCSIS (FDX) is one of two DOCSIS 4.0 flavors available to cable operators, with Extended Spectrum DOCSIS, or ESD, being the other one. This technology has been around since 1997 and continues to evolve today. Since then, the demand and requirements of DOCSIS have. DOCSIS 4.0 is the latest standard developed by CableLabs, designed to push hybrid fiber-coaxial (HFC) networks into multi-gigabit territory. But the original vision for FDX, which calls for a fiber-deep HFC network with zero amplifiers between the node and the home, has made it a non-starter. FDX is a new technology that enables simultaneous downstream and upstream communications over the same cable RF spectrum. How does it work?

I covered some of. What are the challenges of this new standard?

Let's explore. DOCSIS (or Data Over Cable Service Interface Specification) originated in the late 1990s when the cable industry moved from an analog to a digital transmission system.
